1 One way to solve the equation is by using the Distributive Property. $2(1 - x) + 3 = -8$ Write the equation. $2(1) - 2(x) + 3 = -8$ Distributive Property
 $2 - 2x + 3 = -8$ Multiply. $-8 - 2x + 5 = -8$ Combine like terms.

~~Solving Multi-Step Equations~~

In solving the two-step equation in Example 2.1.2, we first isolated the variable expression $(15m)$ and then eliminated the coefficient of (15) by dividing each side of the equation by $(15\text{ text{.}})$ These two steps are at the heart of our approach to solving linear equations. For more complicated equations, we may need to simplify one or ...

The numerical approximation of solutions of differential equations has been, and continues to be, one of the principal concerns of numerical analysis and is an active area of research. The new generation of parallel computers have provoked a reconsideration of numerical methods. This book aims to generalize classical multistep methods for both initial and boundary value problems; to present a self-contained theory which embraces and generalizes the
