The electromagnetic device used for the amplification of electrical signals which utilizes the magnetic saturation of core principle and certain class of transformer's core non linear property is called as Magnetic amplifier. It is invented in early 1885 and is primarily used in theater lighting and it is designed with basic of design Saturable Reactor and hence can be used as saturable reactor in electrical machinery.

Magnetic Amplifiers: Principles and Their Applications

The magnetic amplifier is an electromagnetic device for amplifying electrical signals. The magnetic amplifier was invented early in the 20th century, and was used as an alternative to vacuum tube amplifiers where robustness and high current capacity were required. World War II Germany perfected this type of amplifier, and it was used in the V-2 rocket. The magnetic amplifier was most prominent in power control and low-frequency signal applications from 1947 to about 1957, when the transistor beg
