An open-circuit in one branch of a series-parallel circuit usually alters the current levels in several branches of the circuit. In the case of an open-circuit at one end of the parallel resistors, as shown in figure 7.12 goes to zero. The current through R1 and R2 is now equal to the supply current and is calculated as

This is an interesting series-parallel circuit problem to solve, and it shows once again how a good understanding of circuit theory enables unmeasured variables to be inferred. Students often have difficulty formulating a method of solution: determining what steps to take to get from the given conditions to a final answer.

Because the circuit is a combination of both series and parallel, we cannot apply the rules for voltage, current, and resistance across the board to begin analysis like we could when the circuits were one way or the other. For instance, if the above circuit were simple series, we

The downside to this scheme is that the parallel currents can add up to dangerously high levels. A circuit breaker in series before the parallel branches can prevent overloads by automatically opening the circuit. A 15 A circuit operating at 120 V consumes 1,800 W of total power. P = VI = (120 V) (15 A) = 1,800 W.

Resistor circuits that combine series and parallel resistors networks together are generally known as Resistor Combination or mixed resistor circuits. The method of calculating the circuits equivalent resistance is the same as that for any individual series or parallel circuit and hopefully we now know that resistors in series carry exactly the same current and that resistors in parallel have ...

To solve these type of problems, usually the best way to start is to look at the far side of the circuit opposite to where RAB is. What the equivalent resistance you're looking for is and if that's not the place to start, then what you want to do is you want to look for something that looks easy to combine in terms of either series or a parallel combinations of resistors.

In this problem, we have a resistor network and we want to find the equivalent resistance RAB for the resistor network. RAB is measured at the left-most side of the circuit and the circuit contains this parallel and series combination of resistors. So we look at the circuit and we start by trying to find the easiest components to combine together. And if we look at that, in the right-most side of the circuit we see that we have a three kilo-ohm in series with a six kilo-ohm resistor.

The two resistors that are in parallel are grouped as Req2 in the equivalent circuit below and their resistance is given by the equation $1 / Req2 = 1 / 100 + 1 / 200$ Solve to obtain Req2 = 200 / 3 ? Req1 and Req2 are in series and therefore are equivalent to R given by the sum R = Req1 + Req2 = 500 + 200 / 3 = 1700 / 3 ?
