Dissolution testing measures the extent and rate of solution formation from a dosage form, such as tablet, capsule, ointment, etc. The dissolution of a drug is important for its bioavailability and therapeutic effectiveness. Dissolution and drug release are terms used interchangeably. To properly evaluate the dissolution of drug products, it is critical for procedures to be standardized.

In the pharmaceutical industry, drug dissolution testing is routinely used to provide critical in vitro drug release information for both quality control purposes, i.e., to assess batch-to-batch consistency of solid oral dosage forms such as tablets, and drug development, i.e., to predict in vivo drug release profiles. There are three typical situations where dissolution testing plays a vital role: formulation and optimization decisions: during product development, for products where dissolution

Dissolution test is done using 6 units or dosage forms. These dosages forms are run for the specified time period, sampled and analyzed for the dissolved amount of active ingredient in percentage. This is the first stage of the dissolution and known as S1 Stage. In S1 stage dissolved amount of each unit should not be less than Q+5%.
